PROGRAM 6: Question Answering Using a Pretrained Language Model

AIM

To demonstrate question answering using a pretrained language model through Python.

ALGORITHM

1. Import the Transformers library.
2. Load a pretrained question-answering model.
3. Define the context.
4. Accept a question.
5. Generate the answer.
6. Display the answer.

CODE

```
from transformers import pipeline

model = pipeline(
    "question-answering",
    model="distilbert-base-cased-distilled-squad"
)

context = """
Cloud computing provides computing services through the internet.
It includes servers, storage, databases and networking.
"""

question = input("Ask a question: ")

answer = model(
    question=question,
    context=context
)
```

print("\nAnswer:")

print(answer["answer"])

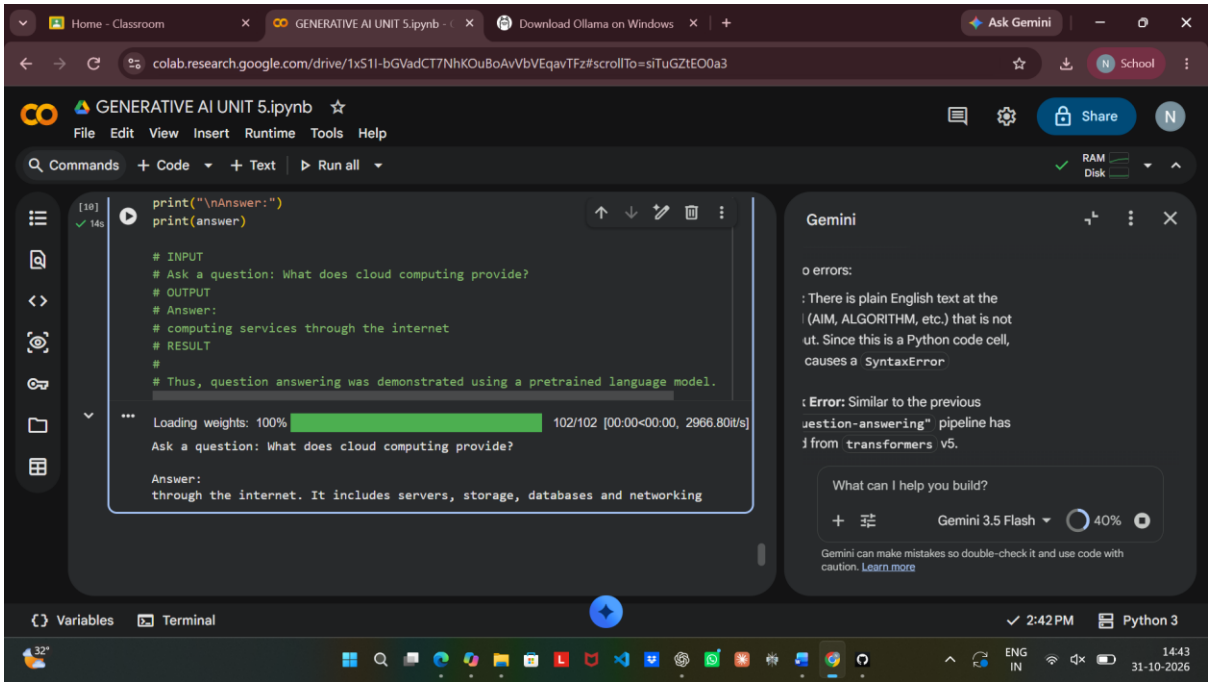

INPUT

Ask a question: What does cloud computing provide?

OUTPUT

Answer:

computing services through the internet

RESULT

Thus, question answering was demonstrated using a pretrained language model.
