PROGRAM 1: Engineering College Student Query Chatbot

AIM

To develop a chatbot that answers common student queries in an engineering college using a pretrained language model.

ALGORITHM

1. Import the required library.
2. Load the pretrained FLAN-T5 model.
3. Define a function to process student queries.
4. Generate an answer using the model.
5. Display the response.

CODE

```
from transformers import pipeline

chatbot = pipeline(
    "text2text-generation",
    model="google/flan-t5-small"
)

def student_chatbot(question):
    prompt = (
        "You are an engineering college assistant. "
        "Answer the student's question clearly and simply: "
        + question
    )

    result = chatbot(prompt, max_new_tokens=100)
    return result[0]["generated_text"]

question = input("Enter your question: ")

answer = student_chatbot(question)
```

print("\nChatbot Response:")

print(answer)

INPUT

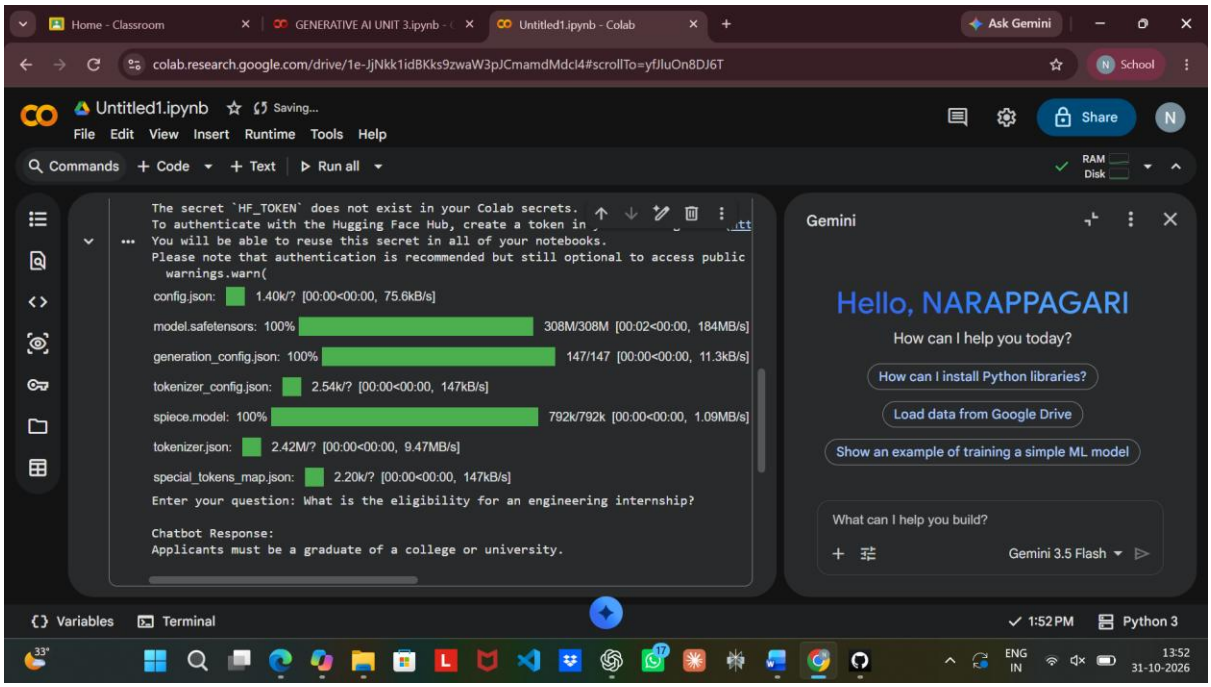

Enter your question: What is the eligibility for an engineering internship?

OUTPUT

Chatbot Response:

Engineering students can apply for internships based on the

company's eligibility requirements and skills.

Note: The actual answer may vary because the model generates responses.

RESULT

Thus, an engineering college student query chatbot was implemented successfully using a pretrained language model.
